

INDIVIDUAL GOALS

Individual only fragments.

Individual or collective, what works better.

AND THE CONSEQUENCE

Collective only dilutes. The right dose depends on how interdependent the work is.

THE CASCADE

Picking a side and living with the side effect.

WHAT YOU SEE

Individual only, and everyone tends their own slice...

THE MECHANISM

...collective only, and nobody knows what their own part is...

THE CONSEQUENCE

...both extremes break the result, by different routes.

| A goal that divides the result divides the team along with it.

THE FORK

The type of work decides the dose.

THE TYPE OF WORK

01

Delivery isolated and measurable? More weight on individual.

02

Delivery dependent on many hands? More weight on collective.

03

Cannot tell? That is the first problem to solve.

The more interdependent the work, the heavier the collective side.

THE METHOD

The right dose, four arrangements.

01 **INDIVIDUAL ONLY**

high clarity, low cooperation, creates solitary deliverers

02 **COLLECTIVE ONLY**

high unity, low clarity, opens room for free riders and heroes

03 **INDIVIDUAL WITH NO NET**

everyone hits their own and the shared result vanishes

04 **BOTH TIED TOGETHER**

individual for clarity, collective for direction, one dashboard

The fourth arrangement only works with one tracker, not with two reports.

IN PRACTICE, IN ORDER

How to calibrate it in practice.

01 • INDIVIDUAL
ONLY

Sales.

heavier on individual, with a collective goal on book or retention

02 • COLLECTIVE
ONLY

Engineering and product.

heavier on collective, delivery always takes many hands

03 • INDIVIDUAL
WITH NO NET

Support and operations.

individual on volume and quality, collective on queue time

04 • BOTH TIED
TOGETHER

Projects.

collective on the milestone, individual on the track each one runs

TWO MODELS

A goal that divides or a goal that adds up.

THE COMMON MODEL

Divides

Everyone watches their own number only

Helping a colleague hurts your goal

The other person's problem is not yours

The one who runs alone wins

THE DESIGNED MODEL

Adds up

Everyone sees the shared number

Helping improves both sides

Dependencies show on the dashboard

The one who unblocks the team wins

MISTAKE AND CONSEQUENCE

Three design mistakes.

01 Putting teams competing for the same bonus.

→ you just bought a conflict and paid a high price for it.

02 A collective goal with nobody's part written down.

→ whoever carries it burns out, whoever rides along settles in.

03 An individual goal that depends on other people.

→ the person loses control and stops committing.

Before you argue about the number, argue about the effect it produces.

THE CHAIN

The free rider and the hero test.

01

Can someone hit their own goal while the team misses?

02

Can someone do almost nothing and still get paid?

03

Yes to either one? The dose is wrong.

WHERE LEADERSHIP STEPS IN

Two questions, thirty seconds, and the goal design reveals itself.

RUN IT THIS WAY NEXT TIME

How to calibrate the dose this week.

STEP 01

Mark which deliveries depend on more than one person.

that list defines how much weight the collective needs

STEP 02

Write each person's part inside the team goal.

one line per person, visible to everyone, no exceptions

STEP 03

Put it all on a single dashboard, not in two reports.

when individual and collective sit together, the talk changes

Clarity comes from the individual. Direction comes from the collective. You need both.

THE MODEL THAT STICKS

The Right Dose, in the order that matters.

The best goal is neither individual nor collective. It is the one that builds real commitment.

SAVE THIS FOR LATER
in your next goal design for the area.
