

MISTAKES

Repeating the same mistake is not bad luck, it is a decision process nobody reviewed.

What to do after the decision goes wrong.

AND THE CONSEQUENCE

The mistake costs once. The wrong criterion costs every time.

THE CASCADE

The mistake becomes a story, not a criterion.

WHAT YOU SEE

The decision goes wrong and you rush to fix the damage.

THE MECHANISM

The damage passes, and the talk becomes a generic lesson over coffee.

THE CONSEQUENCE

Nothing gets written, and the same mistake returns under another name.

A lesson that does not become a written criterion is a memory, and memory has a short shelf life.

THE FORK

What kind of error was that?

WHICH KIND OF ERROR

01

Was information missing that did not exist?

that was a luck error, it happens

02

The information existed and nobody looked?

that was a process error, fix it

03

The information was there and the criterion ignored it?

that was a criterion error, and it repeats

Only the third repeats on its own. That is why it is the only one that demands a record.

THE METHOD

The Autopsy, four cuts.

01 THE FACT

what happened, no adjectives and no culprit

02 THE CRITERION

the rule you used, and whether it still holds

03 THE MISSED SIGNAL

what was already visible and nobody looked at

04 THE RECORD

the line that stays written for the next one
like it

The autopsy does not judge the person. It opens the decision to see what produced it.

WHAT TO ASK, IN ORDER

Four questions, no rationalizing.

01 • THE FACT

What happened, in one sentence with no adjective?

if it has an adjective, it is still a defense

02 • THE
CRITERION

Which rule did you use to decide?

and whether it still makes sense

03 • THE MISSED
SIGNAL

What could already be seen and nobody looked at?

almost always someone was warning about it

04 • THE RECORD

What stays written for the next time?

one line, in the same place as always

TWO MODELS

Two conversations after a mistake.

THE COMMON MODEL

Theatrical post mortem

Starts by hunting who failed

Ends asking for more attention

Produces a document nobody rereads

The mistake returns under another name

THE DESIGNED MODEL

Autopsy

Starts with the criterion that produced the choice

Ends in a changed rule

Produces one line that enters the next decision

The mistake becomes a filter

MISTAKE AND CONSEQUENCE

Three reflexes that erase the lesson.

01 Hunting a culprit before hunting a criterion.

→ the team learns to hide, not to correct.

02 Calling unforeseeable what already had a signal.

→ unforeseeable is the most expensive word in the management vocabulary.

03 Outsourcing responsibility for the fix.

→ whoever decided runs the repair, even if other hands do the work.

| The first two cost trust. The third costs the next decision.

THE CHAIN

The count test.

01

Count how many times this problem has shown up this year.

02

If it is the third, it was never an emergency.

03

Then the mistake is not the event, it is your criterion.

WHERE LEADERSHIP STEPS IN

First time is an accident. Third time is design, and the design is yours.

RUN IT THIS WAY NEXT TIME

Three moves after the next mistake.

STEP 01

Write the fact with not one single adjective.

cleaning the sentence already reveals what was a defense

STEP 02

Name the rule you used and say whether it changes.

out loud, in front of everyone who took part

STEP 03

Keep one line in the same place as always.

a scattered record is a lost record

If there is no same place as always, creating that place is the first fix.

THE MODEL THAT STICKS

The Autopsy, in the order that matters.

The mistake costs once. The wrong criterion costs every time.

SAVE THIS FOR LATER

on the next decision that does not go as planned.
