

AI ON THE TEAM

Automating a badly designed process only produces chaos faster.

How to use AI on the team without it becoming a fad.

AND THE CONSEQUENCE

The tool does not fix design, it accelerates what already exists.

THE CASCADE

The tool arrives before the problem.

WHAT YOU SEE

Someone brings the tool and the team is excited for a month.

THE MECHANISM

Nobody defined which result should change, so nothing changes visibly.

THE CONSEQUENCE

Next quarter the word disappears from the vocabulary and the licence keeps being paid.

A tool with no declared problem becomes a fixed cost with an innovation speech.

THE FORK

Where did you start?

WHERE YOU STARTED

01

Started with the tool?

that is a fad, and it has an expiry date

02

Started with the whole department?

that is a project, and big projects die halfway

03

Started with a result that has a number?

then it is engineering

Whoever starts with the tool has to find a problem for it. That is the order reversed.

THE METHOD

The Screen, four inputs.

01 THE PROBLEM

which result is bad today, with a number and an owner

02 THE SLICE

which specific piece of the work, never the whole department

03 THE MEASURE

what changes in the metric if it works, and in how long

04 THE RITUAL

when the team looks at it, and who corrects it when it drifts

Without the fourth input, the pilot becomes a demo. A demo does not change an operation.

WHAT TO ASK, IN ORDER

Four questions before you sign the licence.

01 • THE
PROBLEM

Which number is bad today?

with no number, it is not a problem yet

02 • THE SLICE

Which piece of the work enters the pilot?

the smaller it is, the faster you learn

03 • THE
MEASURE

What has to change for it to be worth it?

declare it beforehand, not afterward

04 • THE RITUAL

In which ritual will this be reviewed?

and who has the mandate to correct it

TWO MODELS

Two ways to bring AI inside.

THE COMMON MODEL

Fad

Starts with the available tool

Picks the most visible department

Measures by adoption and enthusiasm

Ends in a pretty presentation

THE DESIGNED MODEL

The screen

Starts with the number that is bad

Picks the smallest piece that still matters

Measures by the change in the metric

Ends inside a ritual that already existed

MISTAKE AND CONSEQUENCE

Three ways to waste the tool.

01 Automating an unstable process.

→ you do not gain speed, you gain errors at scale.

02 Putting the new thing outside the existing rituals.

→ whatever does not enter the ritual does not survive month two.

03 Measuring adoption instead of results.

→ everyone using it and no number improved is a failed project with a good photo.

Adoption is a means. If it became the main metric, the objective got lost on the way.

THE CHAIN

The next quarter test.

01

Go back three months and look at the last new thing that arrived.

02

See whether it shows up today in any of the team's rituals.

03

If it does not, it was a fad, and it cost more than the licence.

WHERE LEADERSHIP STEPS IN

What becomes a method disappears from the speech and appears in the routine. The reverse is also true.

RUN IT THIS WAY NEXT TIME

Three moves before the next pilot.

STEP 01

Write down the number that has to improve.

one number only, with today's value and the target

STEP 02

Carve out the smallest possible task.

one stage, one team, one month

STEP 03

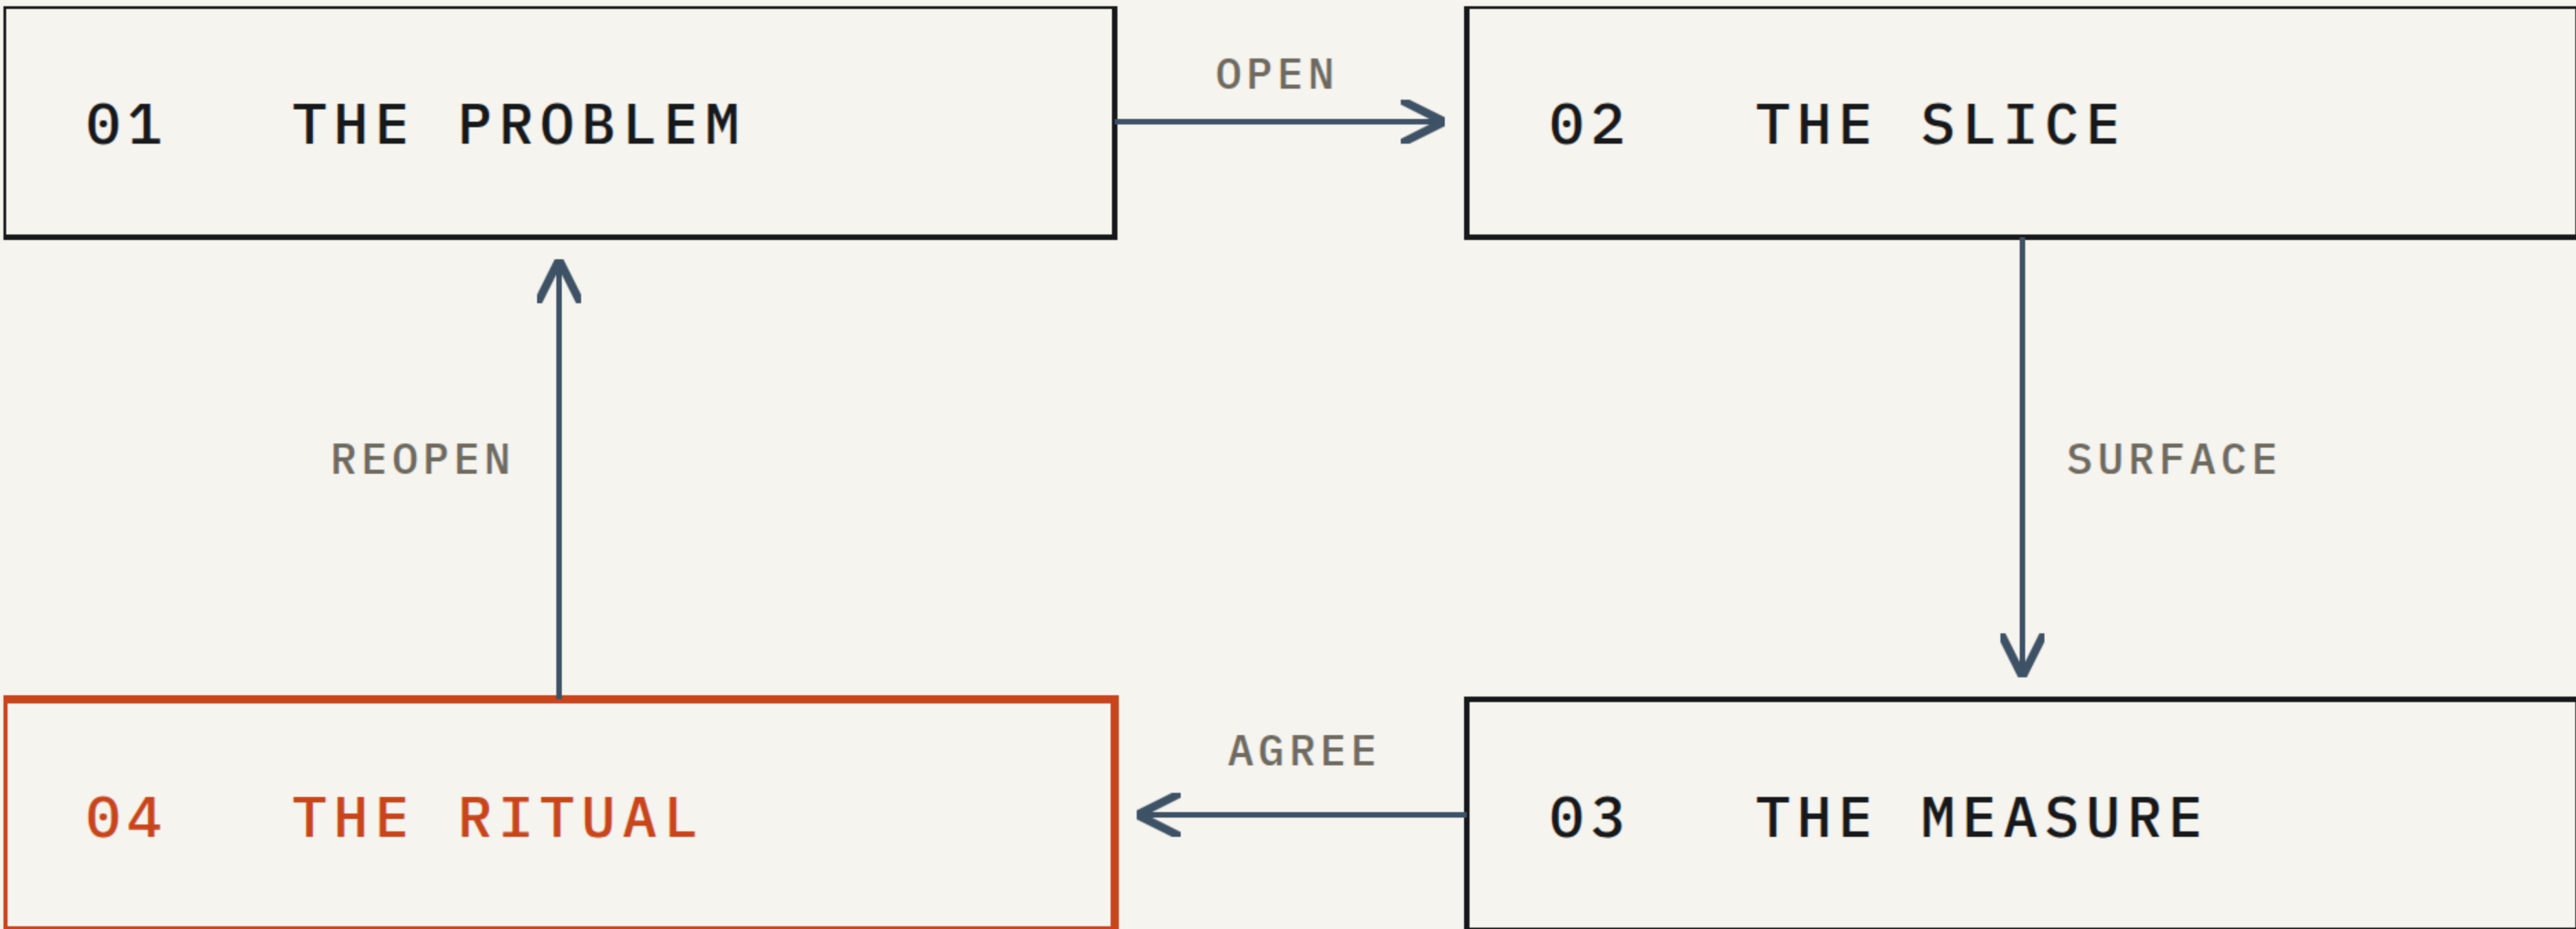

Fit the review into a ritual that already exists.

do not create a new meeting to track something new

If you had to create a meeting to track it, the pilot was born outside the operation.

THE MODEL THAT STICKS

The Screen, a loop and not a list.

AI does not fix bad design. It accelerates what already exists.

SAVE THIS FOR LATER

before the next tool that knocks on your door.
